

Development & Training (offline)

Edge Gateway Platform

IoT Layer

Edge Data Path

REE — Linux OS (untrusted)

TEE — OP-TEE / ARM TrustZone (invoke TA)

Cloud Management & Monitoring

RQ: Hybrid Q-C vs. TinyML for zero-day / unseen attacks under deployability & TEE constraints

Threats mitigated: model tampering; unauthorized replacement; extraction; unauthorized inference; compromised REE

TEE protects: model storage, inference, keys, decision logic

QAI role: anomaly engine inside TEE; not a security primitive

→ data → trusted → deploy
